

PRODUCT DOCUMENTATION

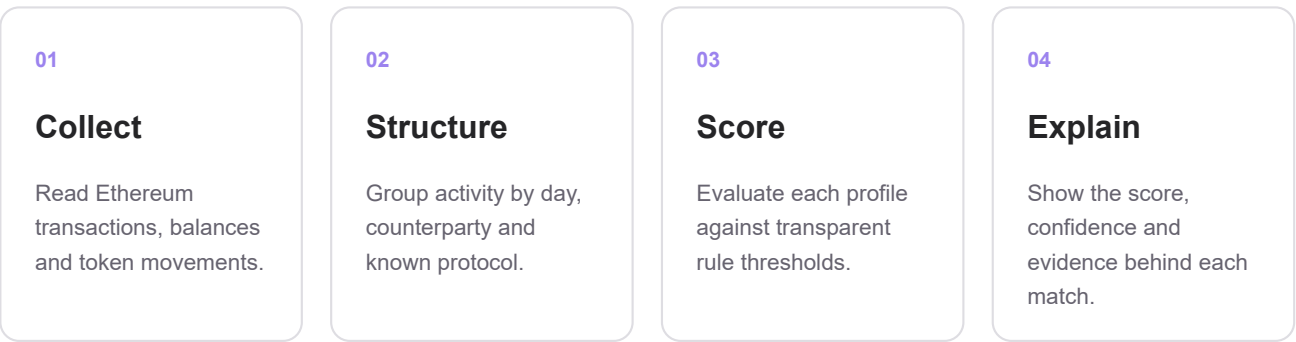

How an Ethereum wallet is profiled

A concise rule-based approach that connects observable onchain activity to explainable behavioral profiles.

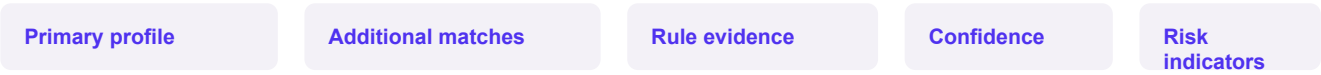

Core principle

The profiler does not infer intent from a single transaction. It combines frequency, recency, holdings, token movements and attributed protocol interactions across the selected period.

The profiling pipeline

What the output contains

Profiles are assessed independently, so one wallet may match more than one behavior. The highest supported result is presented first, while every rule remains visible for review.

Default analysis window

90 days, with 30-day and 180-day alternatives. Wallet age may use the available history beyond the selected window.

RULE SUMMARY

Six profiles, assessed independently

Each profile combines a small set of observable signals. A score of 60 or more is treated

1 Active trader

Transaction frequency and active-day coverage indicate regular, repeated activity.

2 Long-term holder

At least 90 days of history plus limited outgoing value relative to holdings.

3 DeFi participant

Share and breadth of interactions across Uniswap, Aave and Lido.

4 NFT trader

Marketplace trade count and activity share across OpenSea and Blur.

5 Staking participant

Recurring Lido stake or unstake interactions and their share of activity.

6 Dormant or new wallet

Wallet age of 30 days or less, or no observed activity for at least 30 days.

Assignment and interpretation

Threshold	A profile is assigned when its rule score reaches 60/100.
Primary result	The strongest supported profile is highlighted first.
Multiple matches	A wallet can be both active and DeFi-oriented, for example.
Evidence	Every result includes the values that affected its score.

EXAMPLE WALLET

DeFi participant

Illustrative data for the Ethereum address 0x7F00...0003 over a 90-day analysis period.

Transactions	Active days	Transfer volume	Protocols used
1,019	70 / 90	\$184,620	3

Profile rule results

DeFi participant		100/100 Assigned
Active trader		89/100 Assigned
Long-term holder		82/100 Assigned
Staking participant		78/100 Assigned
NFT trader		0/100 Below threshold
Dormant or new wallet		0/100 Below threshold

Supporting evidence

Protocol mix	Uniswap 28.5% Aave 42.7% Lido 28.9%
Activity	11.3 transactions per day across 70 active days
History	180 days of usable wallet history
Attribution	100% of selected-period transactions attributed

This page uses illustrative frontend data and is included to demonstrate the report structure.
